## 1 Introduction

REST services is used to quickly return data from CS OTE system with minimal data overhead. It is primary used to fetch actual market data. It is the same data like in the appropriate business web forms of CS OTE portal.

It is available through the same communication channel like web services. The SSL/TLS with certificate client authentication is used. Clients who already have automatic communication do not have any other network settings.

Services are available only in client-server mode. Client must always send the request.

### 1.1 Security

SSL/TLS protocol is used to ensure data confidentiality. The SSL/TLS client authentication is used like for web services. The request is not digitally signed. But client must have appropriate role assigned to be authorized. Every service is secured by a role.

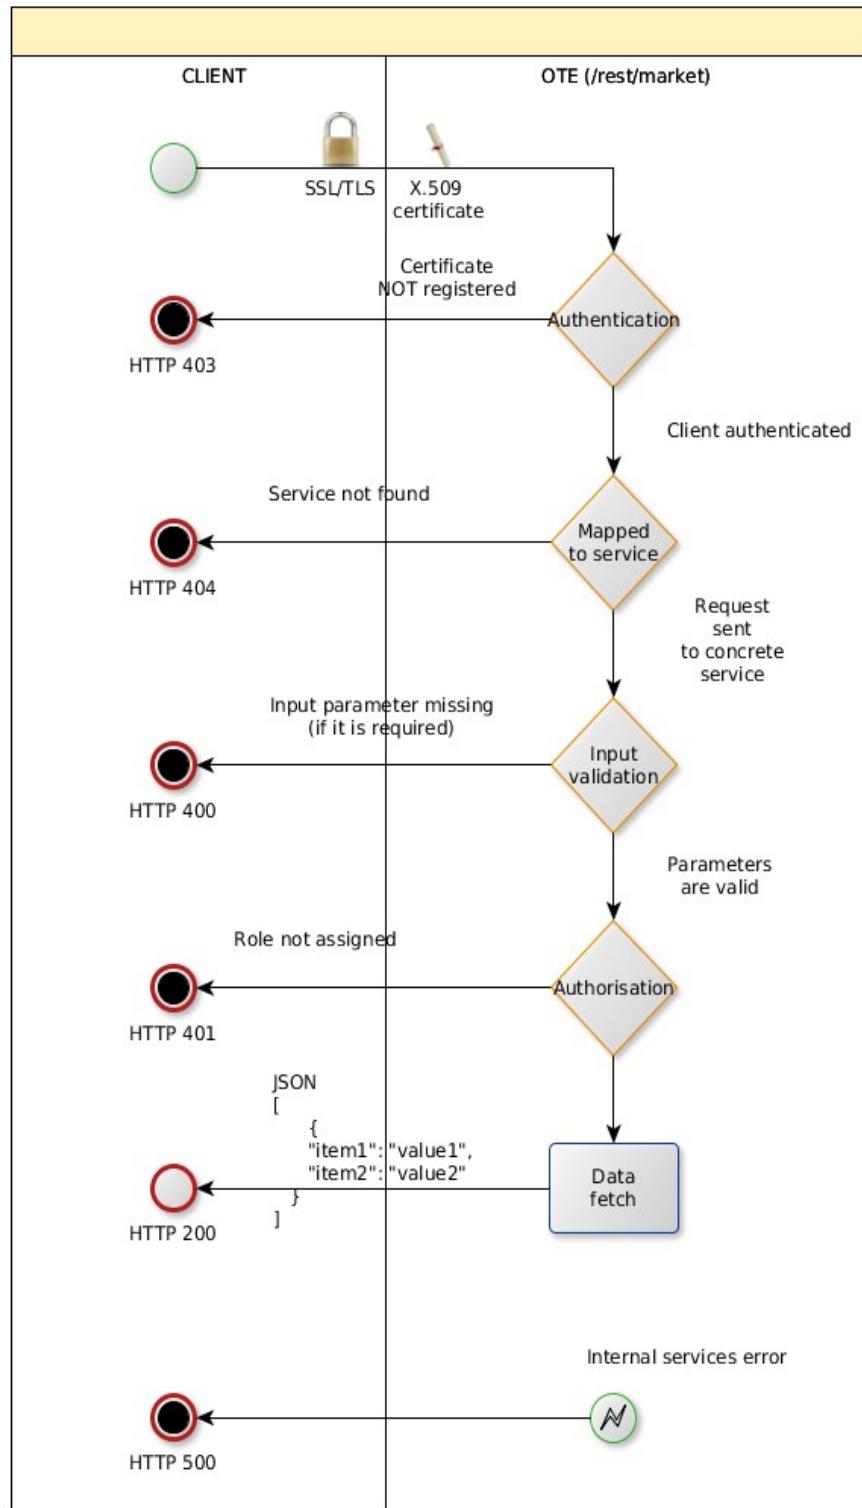

## 2 Service definition

All services can be called only by GET method. Input parameters are passed to the URL. The JSON format is used to data output. It is defined in the [ECMA-404](#) standard.

```
[  
  {  
    "item1": "value1",  
    "item2": "value2"  
  }  
]
```

### 2.1 Communication scenario

Request is always send by REST services client. Output state is returned as HTTP code. There are JSON data in the HTTP response in case of code with value 200.

## 2.3 Output status

- 1) HTTP 200 - success. There is data in the HTTP response. There is empty JSON array ([ ]) in case of empty result set.
- 2) HTTP 400 – missing input parameters (only for some services)
- 3) HTTP 401 – client is not authorized.
- 4) HTTP 403 – client SSL/TLS certificate is not registered in the system
- 5) HTTP 404 – service not found. There should be mistake in the service endpoint or server name. For example csote.ote-cr.cz instead of market.ote-cr.cz.
- 6) HTTP 500 – internal server error.
