

Information about System Upgrade of Intraday gas market

OTE is preparing system upgrade of the Intraday gas market platform in response to the rapid development of the gas markets and trading standards on the European short-term markets, as well as in information technology. These changes are planned for September/October of this year.

The upgrade is based on state of the art communication and application technologies. This will speed up work within the trading system, implement changes to financial security and to the graphical user interface, and introduce new ways of managing bids. Additionally, this upgrade will provide a user friendly platform which will allow users to react immediately to the current market situation. We believe that this will enable more efficient usage of our system in order to implement individual market strategies.

This step also means unifying of technology used for trading on the Intraday electricity market and the Intra-day gas market.

Basic information regarding the upgrade can be found in the [presentation](#). Information regarding the testing, expected cooperation with market participants and implementation into the production environment will be distributed at the end of May/June.
